

1. (10 points, 1 point off for each incorrect item, no negative scores)

2. (6 points, 3 points each, -1 for each wrong answer, no negative scores)

- a) a, d, c, b
- b) b, a
- c) b, c, a

3. (6 points, 2 points each)

- a) Not valid (x incremented, it can't still be 1}
- b) Not valid (if  $x == -1$ , x will equal 0 after execution)
- c) Valid

4. (6 points, 2 points each)

- a) Valid
- b) Not necessarily valid
- c) valid

5. (12 points, 2 points each condition)

- a)

$P: \{((x \geq 0) \ \&\& \ (x \neq 0)) \ || \ ((x \neq -1) \ \&\& \ (x < 0))\} = (x > 0) \ || \ (x < -1)$   
 if  $(x \geq 0)$  {  
      $\{wp(z=x, z \neq 0) = (x \neq 0)\}$   
      $z = x;$   
 }  
 else {  
      $\{wp(z=x+1, z \neq 0) = (x+1 \neq 0) = (x \neq -1)\}$   
      $z = x+1;$   
 }  
 Q:  $z \neq 0$

b)  
 $P: \{wp(b=b+1, b > 0) = \{b+1 > 0\} = (b > -1) \text{ equivalent } (b \geq 0)\}$   
 $b = b + 1$   
 $\{wp(a = b+1, a > 0 \ \&\& \ b > 0) = (b+1 > 0 \ \&\& \ b > 0) = ((b > -1) \ \&\& \ (b > 0)) = (b > 0)\}$   
 $a = b + 1$   
 $\{a > 0 \ \&\& \ b > 0\}$

c)  
 $P: wp(t=x, y > t) = (y > x)$   
 $t = x;$   
 $wp(x=y, x > t) = (y > t)$   
 $x = y;$   
 $wp(y=t, x > y) = (x > t)$   
 $y = t;$   
 $\{x > y\}$

6. (12 points, 2 points for each condition.

a)  
 $\{ \ x < 0 \ \&\& \ y > 0 \ \}$   
 $y = 2;$   
 $\{ \ x < 0 \ \&\& \ y = 2 \ \}$   
 $x = x + y;$   
 $\{x\_old < 0 \ \&\& \ x == x\_old + y \ \&\& \ y == 2\} = \{x < 2 \ \&\& \ y == 2\}$

b)  
 $\{ \ |x| > 2 \ \} = \{x \geq 3 \ || \ x \leq -3\}$   
 $x\_1 = x * 2;$

```

    { x_1 >= 6 || x_1 <= -6}
    or you could also say { |x| > 4 }
    // should be { x_1 >= 6 || x_1 <= -6 && x_1 is even }
    // or { |x| > 4 && x is even }
x_2 = x_1 - 1;
    { x >= 5 || x <= -7 } or also { x > 3 && x < -5 }
    // should be { x >= 5 || x <= -7 && x is odd }
    // or { x > 3 && x < -5 && x is odd }

```

In a case like this I would give credit for the answer { x >= 5 || x <= -7 } or {x > 3 || x < -5}.

7. (12 points, 2 points each)

- a) false
- b) false
- c) false
- d) true (if a is null, precondition that key is contained in a is violated)
- e) true
- f) false (fails if a is not sorted)
- g) false
- h) false

8 (12 points)

	(a)	(b)	(c)	(d)	(e)
(i)	X				
(ii)	X	X		x	X
(iii)					
(iv)	X	X			X
(v)	x	x			x

Why isn't iii, e checked?

If you assume Java, it returns a negative value for a negative argument.

For example,

System.out.println(-25 % 10) prints -5.

In C

```

x = 5 % (-3);
y = (-5) % (3);
z = (-5) % (-3);

```

`printf("%d,%d,%d", x, y, z);` prints (2, -2, -2) in gcc.

See this <https://stackoverflow.com/questions/11720656/modulo-operation-with-negative-numbers> discussion for more details about the C case.

In Python

```
>>> -25 % 10
```

```
5
```

```
>>>
```

Given the Python result, on a test, I would have to give credit for specifying that it could return a non-negative number.

L1:  $n \leq \text{arr.length}$  &&  $p = \text{arr}[0] * \text{arr}[1] * \text{arr}[2] \dots \text{arr}[n-1]$  (2 points)

Or L1:  $n \leq \text{arr.length}$  &&  $p = \text{prod}(\text{arr}[0].. \text{arr}[n-1])$

D:  $\text{arr.length} - n$  (2 points)

Proof:

Base:  $n = 1$ ;  $p = \text{arr}[0]$ , only one element and it's equal to  $p$ , so base case holds (3 points)

$p == \text{arr}[0] \Rightarrow \text{prod}(\text{arr}[0].. \text{arr}[n-1]) == \text{arr}[0]$

$n == \text{arr.length} == 1 \Rightarrow n \leq \text{arr.length}$  ( $\text{arr.length}$  can't be 0)

Induction: step  $k$ , assume  $p(k) = \text{arr}[0] * \text{arr}[1] * \text{arr}[2] \dots \text{arr}[n(k)-1]$  is true (4 points)

$n(k) \leq \text{arr.length}$

Step  $k + 1$ :

$n(k+1) = n(k) + 1$

$p(k+1) = p(k) * \text{arr}[n(k)] = p(k) * \text{arr}[n(k+1) - 1]$

$p(k+1) = (\text{arr}[0] * \text{arr}[1] * \text{arr}[2] \dots \text{arr}[n(k) - 1]) * \text{arr}[n(k+1) - 1] = \text{arr}[0] * \text{arr}[1] * \text{arr}[2] \dots \text{arr}[n(k+1) - 1]$

at step  $k$ ,  $n(k) < \text{arr.length}$  or we would have exited.

at step  $k+1$ ,  $n(k+1) = n(k) + 1 \Rightarrow n(k+1) \leq \text{arr.length}$

Decrementing: (3 points)

$D(k) = \text{arr.length} - n(k)$

$D(k+1) = \text{arr.length} - n(k+1) = \text{arr.length} - (n(k)+1) = D(k)-1$

$D_{k+1} < D_k$

$D = 0 \Rightarrow \text{arr.length} == n \Rightarrow \neg(n < \text{arr.length})$

Partial correctness (3 points)

$\neg(\text{exit condition}) \ \&\& \ \text{LI} \Rightarrow \text{postcondition}$

$\neg(n < \text{arr.length}) + (n \leq \text{arr.length} \ \&\& \ p == \text{prod}(\text{arr}[0].. \text{arr}[n-1]))$

$\Rightarrow (n == \text{arr.length}) \ \&\& \ (p == \text{prod}(\text{arr}[0].. \text{arr}[n-1]))$

$\Rightarrow p = \text{prod}(\text{arr}[0].. \text{arr}[\text{arr.length}-1])$

10) 10 points

a) (5 points)

Requires: true or none

Modifies: nothing

Effects: none

Returns: `this[index]`; element at index

Throws: `IndexOutOfBoundsException` - if the index is out of range (`index < 0 || index >= size()`)

b) (5 points)

$E = \text{if } \text{index} < 0 \ || \ \text{index} \geq \text{size}$

    Throws `IndexOutOfBoundsException`

    Else

        return `this[index]`

true  $\rightarrow E \ \&\& (\text{this\_post}[i] == \text{this\_pre}[i] \text{ forall } i :: 0 \leq i < \text{size})$

or

true  $\rightarrow E \ \&\& (\text{nothing is modified})$

11. (16 points)

a) (2 points)

LI:  $(\text{total} + x*y == a*b) \ \&\& \ (x \geq 0)$

b) (2 points)

initially  $x=a, y=b, \text{total}=0$

LI:  $(\text{total} + x*y == a*b) \ \&\& \ (x \geq 0)$

Substituting values  $(0 + a*b == a*b) \ \&\& \ (a \geq 0)$

The first term is true by definition, second term is true by the precondition

c) (8 points) (4 points each for even and odd cases)

assume:  $\text{total} + x*y == a*b) \ \&\& \ (x \geq 0)$  holds at iteration  $k$ .

Two cases:

$x$  is even:

$x_{\text{new}} = x / 2$

```

y_new = y * 2
total_new = total
total_new + x_new*y_new = total + (x/2) * (y*2) = total + x*y = a*b

```

x is odd:

```

total_new = total + y
x_new = (x-1) / 2
y_new = y * 2
total_new + x_new*y_new
= (total+y) + ((x-1)/2) * (y*2)
= (total + y) + (x-1)*y
= total + x*y = a*b

```

At iteration k,  $x \geq 0$ , if  $x = 0$  at iteration k, we don't have iteration k+1.  $x_{\text{new}}$  is either  $x/2$  or  $(x-1)/2$  in either case  $x_{\text{new}} \geq 0$ .

d) (2 points)

```

!(x > 0) && ((total + x*y == a*b) && (x >= 0))
    = (x==0) && (total + x*y == a*b)
    = total == a*b

```

e) (2 points)

$D = x$

Initially  $x \geq 0$  by the precondition. At each iteration  $x_{\text{new}} = x/2$  or  $x_{\text{new}} = (x-1)/2$  so it decreases:  $D_{\text{new}} < D$

When  $D = 0 \Rightarrow x=0 \Rightarrow !(x>0);$
